In order to add to local efforts to increase awareness of infant mortality, maternal mortality, and the environment’s role in our health, the Florida Department of Health in Miami-Dade and the Health Council of South Florida have created a toolkit that includes messages and images for organizations and individuals to share on social media platforms. See below for sample messages and articles.

Social Media

Sample Message:

Did you know? Maternal mortality rates in Miami-Dade are quite high - they are even higher in Black or African American Populations. To learn more about maternal mortality in our region visit: [LINK].

Sample Message:

Air quality plays a major role in you and your baby’s health. Emissions, or gases released into the air, can range in sizes and can enter your lungs and/or bloodstream. To learn more about air quality and its health effects visit: [LINK]
Did you know? The Health Council of South Florida in partnership with FDOH-Miami Dade released a report on birth outcomes and environmental factors. To read the report, visit: LINK

Sample Message:

Did you know? 1% of births in Miami-Dade County did not receive any prenatal care? For more information on LINK.

Miami-Dade County, 2018

79.5% of mothers visited the doctor on a regular basis during their pregnancy.

1% of births with known prenatal care status did not receive any prenatal care.

Blog Posts/Newsletter Articles

Article 1:
The Health Council of South Florida and the Florida Department of Health in Miami-Dade have released a new report called the Environmental Public Health Tracking Project. The report uses maps to highlight birth outcomes in Miami-Dade County and overlaps them with environmental and socio-economic factors including poverty, insurance coverage, and air quality. While disparities between race and ethnicity are common, this report highlights health disparities within geographical regions. Regions such as Palmetto Bay (33157), and Homestead (33033 & 33039) were on the list having infant mortality and pre-term birth rates and poverty and uninsured rates above Miami-Dade’s and Florida’s. To read the full report visit: LINK.

Article 2:
Maternal Mortality and Infant Mortality are hot topics in the field of public health as they continue to rise despite recent advances in the Maternal Child Health sectors. Although 60% of Maternal deaths are preventable (CDC, 2019), Black women in Miami-Dade County had a maternal mortality rate that was 4 times higher than White women in 2018. A similar trend is seen in infant mortality, where the Black rate is up to 3 times higher than White infants (FLHealthCharts, 2018).

What are some ways that providers can help improve these statistics?

- Provide culturally sensitive and appropriate care both pre- and postnatally.
- Increase access to quality and affordable prenatal and infant care
- Appropriate care for high-risk individuals
- Continuation of care after delivery.

Article 4:
Air-quality is a huge concern, especially in urban areas found throughout Miami-Dade County. Air pollution, which can consist of emissions from vehicles and industrial sites, has the potential to trigger asthma attacks in young children and adults, and make conditions like COPD difficult to control. Air pollution in the form of particulate matter, has been linked to postneonatal deaths (including Sudden Infant Death Syndrome [SIDS])\(^1\), high rates of ER visits, low-birth weight, lung cancer, and even decreased lung growth in children\(^2\). For up-to-date information on Florida air quality visit the Florida Department of Health’s Environmental Tracking page.
